

# MODULE 8

ABI WHITFORD

FOLDER ORGANIZATION

## ORGANIZATION OF FOLDERS

I chose to organize my folders by the written and design parts of the modules. Anything that was a word document (or PDF of a word document) I put in a folder called “wmodule”. “wmodule” stands for written modules. This also included the zip folder because I felt that as a complete module, it belonged where the other stand-alone modules were (as in complete by just being a written document).

The next folder is the “mocks” folder, short for mockups. In this folder are all the design aspects of my website. This is everything from the wireframes of module 5 to the type card, color palette, and final, colored psd files of my website of module 6. Inside this folder are two more folders, “wire” and “final”. “wire” holds all module 5 wireframes, and “final” holds the type card, color palette, and final, colored psd files of my website.

My final folder is the challenge1 folder, as we do more challenges in class I can create a “challenges” folder and then put numbered challenge folders inside.

## REASONING

I organized my files this way because I thought having a folder for each module would be pointless and create more folders than necessary. Thus, I wanted to divide them in a way that made sense to me. I liked the idea of separating them based on on image and written content, as I organize a lot of other files on my computer like this. That’s where I came up with the “wmodule” and “mocks” folder. The challenges folder needed its own folder since it didn’t fit into either category. I also left the index.html and style.css sheet on the front to know that those are the sheets that correspond with my course page. As I make more html and css sheets they can go into their corresponding folders. This also applies to all future files. If I start to make more sites, designs, etc. I will have to add more folders in and perhaps rename folders, to accommodate any changes that will help me keep organized.
